PROFESSIONAL SUMMARY

Full-stack developer with 3+ years shipping production React and Node.js features end to end for a multi-product SaaS company. Build and maintain two large Next.js (App Router) applications—a 300+ screen admin console and a customer-facing storefront—against 30+ Express microservices, owning both the UI and the REST APIs behind it. Work daily across JavaScript and TypeScript, asynchronous data flows, Redux Toolkit and TanStack Query state, RS256 JWT authentication with RBAC, and shared component and utility layers that keep delivery fast. Also built the platform's in-product generative-AI assistant—an LLM agent with tool-calling, per-tenant encrypted keys and usage metering—plus an MCP server exposing the same capabilities to external AI clients.

TECHNICAL SKILLS

Frontend: React (18 & 19), Next.js (App Router, SSR/ISR), JavaScript (ES6+), TypeScript, React Hooks, Redux Toolkit, Zustand, TanStack Query, reusable component libraries, Tailwind CSS, HTML5, CSS3, Recharts, responsive UI

Backend: Node.js, Express.js, REST API design, microservices, asynchronous programming, authentication and authorization flows, JWT / RS256 SSO, RBAC (CASL), schema validation (Zod), error handling, webhooks, cron and background jobs, NATS messaging

Stacks: PERN stack, Next.js full-stack, Turborepo / pnpm monorepos

Databases: PostgreSQL, MySQL, Prisma, Sequelize, schema migrations, multi-tenant data modeling, indexing and query optimization

AI Engineering: Generative AI / LLM integration (Groq, Llama 3.1), agentic tool-calling loops, Model Context Protocol (MCP) servers, AI-assisted product features, prompt design, usage metering and cost control; Claude Code for development

Testing & Quality: Unit and integration tests, API contract testing (Postman), debugging, profiling and performance tuning, code reviews, Git-based workflows, ESLint / Prettier

Servers & DevOps: Git, Bitbucket, Jenkins, Docker, Kubernetes, Nginx, Apache, Linux administration, cPanel, CWP (CentOS Web Panel)

Cloud & Storage: Cloudflare (DNS, custom domains), Cloudflare R2, AWS S3 SDK

Payments: Stripe, PayPal, Razorpay, Cashfree, PayU, Adyen, Paystack, Checkout.com, PayHere, Pesapal

Integrations: Zapier, HubSpot, SendGrid, Postmark, Dropbox Sign, Zoho CRM, Basecamp, Shiprocket, Google Ads, Meta, Trustpilot, WordPress, Shopify, Webflow

PROFESSIONAL EXPERIENCE

Webnexs — Chennai, India

Product Developer – Full Stack (React / Node.js) | *Jan 2024 – Present*
Node.js Developer Intern | Jun 2023 – Dec 2023

Wcart – multi-tenant ecommerce SaaS (Next.js / React front ends on Node.js microservices)

- Build and maintain the Wcart admin console in Next.js 14 (App Router) and React 18—300+ screens across catalog, orders, payments, customers and a drag-and-drop page, header and footer builder—using Redux Toolkit for cross-screen state and Recharts for 40+ analytics reports.
- Ship the customer-facing storefront in Next.js and React with server rendering for SEO, live updates over Socket.IO, HLS video commerce and 3D/AR product viewing, keeping first-load payloads down through route-level code splitting, image optimization and render profiling.
- Factor shared UI into reusable components, hooks and utilities with Tailwind design tokens, so new admin screens and plugin UIs are assembled from existing pieces rather than rebuilt each time.
- Translate product requirements into clean, maintainable components and the matching backend services, working directly with designers and QA through review, release and feedback.
- Core backend developer across 30+ Express microservices—catalog, cart, order, payment, shipping, subscription, CMS, media and notification—each owning its own database, with every read tenant-scoped and every route carrying an explicit contract, request validation and consistent error handling.
- Implement authentication and authorization flows across the estate: RS256 JWT single sign-on with JWKS key rotation, role-based access control and per-tenant scoping enforced server-side rather than in the UI.
- Built and maintained 10 payment gateway integrations—Stripe, PayPal, Razorpay, Cashfree, PayU, Adyen, Paystack, Checkout.com, PayHere and Pesapal—behind one provider interface, so adding a gateway requires no change to checkout or order code.
- Developed 15+ commerce plugins sold as paid add-ons, including abandoned-cart recovery, multi-currency, multi-language, reward points, upsell and cross-sell product recommendations, product comparison, video commerce and spin-wheel promotions, each gated by the tenant's subscription plan.
- Write unit and integration tests for backend services, take part in code reviews, and tune both sides of the stack—profiling React renders on the front end, and cutting backend response times through query and index optimization.

- Traced and fixed cross-service data defects in production, including a currency mismatch that billed every store in USD regardless of location and a config-write bug that had never allowed certain settings tables to create a first row.

AI-enabled features in Wcart

- Built Cartana, Wcart's in-product AI assistant—a Groq-backed (Llama 3.1) Express service running an agentic tool-calling loop that answers merchant questions in natural language and summarizes live store data by calling the platform's own APIs with the caller's bearer token, so tenant scope and RBAC are enforced downstream exactly as for a human admin.
- Added per-tenant LLM key management with AES-256-GCM encryption—plaintext never stored, logged or returned—live key validation against the provider, and automatic fallback to a platform default key.
- Built the AI credit and usage ledger, with per-feature cost configuration, usage logging and an audit trail, so AI features run with measurable, capped spend per tenant instead of open-ended cost.
- Built an MCP (Model Context Protocol) server over Streamable HTTP with scoped API-token auth, exposing the same tenant-scoped capabilities to external AI clients from one shared capability registry.
- Built an LLM-backed sales automation service for internal use, plus workflow automation flows across Node.js, Python and Zapier that move leads, notifications and reporting between systems with no manual step in between.

Webnexs Baseapp – internal CRM and deployment platform

- Primary developer of Webnexs Baseapp, the company platform for leads, clients, subscriptions, payments and product deployments; built the original Node, Express and MySQL application and drove its rebuild onto a PostgreSQL microservice architecture with a Next.js React admin front end.
- Automated the full customer journey from lead form submission through to live deployment handover—payment capture, provisioning, DNS setup, plan entitlements and customer notification now run end to end, removing the engineer previously needed for every signup.
- Connected Baseapp to Wcart and Flicknexs (OTT and video streaming) over payment APIs and webhooks, so tenant subscriptions, upgrades and deployment lifecycle are initialized and billed from a single system across products, with plan entitlements read from configuration so new offers ship without code changes.

Internal DevOps and work-management platform (TypeScript, React)

- Built a cloud-native internal platform of 16 TypeScript services (Express, Prisma, PostgreSQL, NATS, Docker) covering work tracking, OKRs, meetings, KPI reporting, server connections, Bitbucket integration and deployments.
- Built its Next.js and React PWA front end with TanStack Query for server state, cache invalidation and optimistic updates, behind a gateway service handling JWT verification, proxying and Zod request validation.
- Enforced authorization with CASL ability definitions shared across services, standardized logging, health checks and lifecycle handling in shared workspace packages, and built an in-house ticketing system used across Webnexs products.

Client platform – whisky cask investment and retail (Braeburn Whisky, Cask88, Dekanta)

- Sole developer and direct client contact for a whisky client running three brands from one shared Express, MySQL and Handlebars codebase—a staff admin panel and an investor dashboard per brand, covering the full cask ownership lifecycle with Stripe payments, multi-currency valuation, generated PDF and XLSX documents, and Dropbox Sign, HubSpot, Zapier and IMAP email integrations that file agreements and enquiries against the right lead automatically.

Infrastructure and operations

- Managed cPanel and CWP deployments for Wcart and Flicknexs—provisioning, domains, SSL and server-side failures—and contributed to migrating the estate to containerized, Kubernetes-orchestrated infrastructure.

PROJECTS

Starlight Shop – full-stack ecommerce platform (personal project, in progress)

- Building a storefront and admin console in Next.js 15, React 19 and TypeScript, structured as a Turborepo monorepo with a shared UI package and a Zod contract package used by both client and server, so request and response shapes cannot drift.
- Roughly 20,000 lines across 59 App Router routes and REST route handlers (products, categories, orders, auth, payment webhooks), with Prisma and PostgreSQL, Zustand client state, JWT access/refresh authentication with bcrypt, and S3-compatible media storage.

EDUCATION

M.Sc. (Master of Science) Computer Science – St. Peter's Institute of Higher Education and Research, Chennai 2021 – 2023

B.C.A. (Bachelor of Computer Applications) – St. Peter's Institute of Higher Education and Research, Chennai 2018 – 2021
